

Computer Networks

Lab Work Sheet

Description:

Routers forwarding IP packets perform minimum required processing for efficiency. For instance, the sender IP is not considered by routers. This situation can result in security issues in the network.

Aim:

The aim of this lab work is designing and developing experiments to test the security issues when forwarding IP packets.

Output:

You should design your own method for testing the above mentioned issues and develop necessary codes. You are required to run your code and explain how it works, and what we can conclude from this experiment.
